

MURPHY'S POINT PROVINCIAL PARK

One Malaise trap was deployed at Murphy's Point Provincial Park in 2014 (44.78118, -76.2336, 143m ASL; Figure 1). This trap collected arthropods for twenty weeks from May 8 – September 25, 2014. All 10 Malaise trap samples were processed; every other sample was analyzed using the individual specimen protocol while the second half was analyzed via bulk analysis. A total of 4491 BINs were obtained.

Over half the BINs captured were flies (Diptera), followed by bees, ants and wasps (Hymenoptera), moths and butterflies (Lepidoptera), and beetles (Coleoptera; Figure 2). In total, 930 arthropod species were named, representing 23.1% of the BINs from the site (Appendix 1). All but 2 of the BINs were assigned at least to family, and 55.2% were assigned to a genus (Appendix 2). Specimens collected from Murphy's Point represent 250 different families and 954 genera.
