

## FRONTENAC PROVINCIAL PARK

One Malaise trap was deployed at Frontenac Provincial Park in 2014 (44.51783, -76.53944, 176m ASL; Figure 1). This trap collected arthropods for twenty weeks from May 9 – September 25, 2014. All 10 Malaise trap samples were processed; every other sample was analyzed using the individual specimen protocol while the second half was analyzed via bulk analysis. A total of 3372 BINs were obtained.

Half of the BINs captured were flies (Diptera), followed by bees, ants and wasps (Hymenoptera), moths and butterflies (Lepidoptera), and true bugs (Hemiptera; Figure 2). In total, 750 arthropod species were named, representing 24.6% of the BINs from the site (Appendix 1). All but 1 of the BINs were assigned at least to family, and 58.2% were assigned to a genus (Appendix 2). Specimens collected from Frontenac represent 232 different families and 838 genera.
